1.0 INTRODUCTION

This report documents Concrete Joint Material (CJM) Removal activities performed at North Boeing Field (NBF) in Seattle, Washington. NBF is located east of East Marginal Way South, adjacent to the King County Airport (Figure 1). Concrete Joint Removal activities were conducted by The Boeing Company (Boeing). Activities described in this report began in August 2011 and were completed in September 2011. The objective of the Concrete Joint Removal activities was to remove all CJM in areas of the NBF flightline where CJM was known to contain concentrations of total polychlorinated biphenyl's (PCBs) greater than or equal to 50 milligrams per kilogram (mg/kg). CJM removal activities were performed in general accordance with the *Concrete Joint Removal Work Plan, North Boeing Field, Seattle, Washington* (Work Plan, Landau Associates 2011a), which was approved by the Washington State Department of Ecology (Ecology) on August 5, 2011 (Edens 2011). Approximately 5,725 linear feet (ft) of CJM were removed. CJM removal areas are shown on Figure 2.

CJM at NBF was found to contain concentrations of total PCBs above and below 50 mg/kg. CJM sampling performed during the *Human Health Risk Assessment* (HHRA; Landau Associates 2011b) and subsequent characterization sampling events (Landau Associates 2011c) identified some CJM with PCB concentrations greater than or equal to 50 mg/kg. Use of products containing concentrations of PCBs greater than or equal to 50 mg/kg is not currently authorized by EPA, and CJM containing elevated concentrations of PCBs was suspected to be a source of PCBs detected in flight line catch basins. Consequently, Boeing has focused 2011 removal activities on CJM with total PCBs greater than or equal to 50 mg/kg. CJM sample locations from historic sampling events, HHRA sampling events, and subsequent characterization sampling events are provided on Figure 2. Figure 2 also shows the areas in which CJM was removed since 2001. After removal, CJM with total PCB concentrations greater than or equal to 50 mg/kg was considered PCB bulk product waste and disposed of in accordance with 40 C.F.R. § 761.62. Confirmation sampling was not performed during CJM removal activities because joint materials were completely removed from each area.

This report provides a description of the CJM removal and resealing procedures (Section 2.0), a description of runoff control measures (Section 3.0), waste management procedures (Section 4.0), and decontamination procedures (Section 5.0).

2.0 JOINT MATERIAL REMOVAL AND RESEALING ACTIVITIES

Between August and September 2011, approximately 5,725 linear ft of CJM was removed from the NBF Flight Line area. As described above, CJM was removed from the areas where total PCBs were detected at concentrations greater than or equal to 50 mg/kg during the HHRA and subsequent characterization sampling activities. Between 2001 to 2006, approximately 81,000 linear ft of CJM was removed from flight line areas.

Removal and disposal of CJM was conducted in a manner to minimize the releases of PCBs to the environment and allow for proper disposal of the material. The procedures described below were used to reduce the potential for deposition of CJM fragments on nearby paved surfaces, which could discharge to the stormwater drainage system. CJM removal was conducted by Boeing personnel who are familiar with CJM removal procedures and had the health and safety training described in section 3.0.

Removal activities included setting up an exclusion zone, contamination reduction zone, and support zone at each area where CJM was removed. All proper personal protective equipment (PPE) was worn for each CJM removal task, in accordance with the health and safety plan provided in the Work Plan. Removal procedures included saw cutting, manual extraction, pressure washing, residual scraping, and cleanup. These removal activities are described in the sections below.

2.1 SAW CUTTING

In most areas of CJM removal, CJM was removed from the concrete expansion joint by cutting along each side of the joint with a concrete saw. The saw blade was set to cut to the bottom of the existing joint and skim the side of the joint. During cutting, the blade was cooled and lubricated with water. A walk-behind flat concrete saw with a 5/8-inch blade was used for all saw cutting activities where access allowed. A hand-held flat concrete saw was used in locations that were not easily accessible to the walk-behind saw cutter, such as against building foundations. Drum vacuums were used to control and capture the water and slurry generated during the cutting operations. Removed solid material was placed in drums.

2.2 MANUAL EXTRACTION

After both sides of the expansion joint were cut, as much material as possible was manually extracted by hand and knife blade. Manual extraction was also used in hard-to-access areas where the walk-behind saw cutter or the hand-held flat concrete saw could not effectively maneuver. Removed solid material was placed in drums.

2.3 PRESSURE WASHING

Pressure washing was used as another method for removing small pieces of CJM. Pressure washing was also used to clean the joint areas prior to placement of the new sealant. Pressure washing with a fan tip was used to clean the slurry and debris out of the joint and from the top of the concrete surrounding the joint. Drum vacuums were used during all pressure washing operations to control and capture the wastewater.

2.4 RESIDUAL SCRAPING AND CLEANING

Following saw-cutting, manual extraction, and pressure washing (or any combination of the three removal techniques), hand grinders with dust directors were used to remove any residual material not previously removed and to prepare the joint for placement of backer rod and new sealant. Street sweepers were also used by the contractor to scrub and vacuum dry surfaces around the work areas where CJM was removed.

2.5 RESEALING ACTIVITIES

When joint removal and cleaning activities were complete, polyethylene backer rod was placed along the length of each joint in preparation for resealing. The backer rod is also used to control the depth of the sealant. Following placement of the backer rod, a primer solution was sprayed inside the joint and over the backer rod. Concrete joints were resealed with Urexpan® NR-300 manufactured by Pecora Corporation. Urexpan® NR-300 is a two-part, chemically curing, cold-applied self-leveling modified polyurethane elastomeric sealant. The Urexpan® NR-300 technical specifications data sheet is provided as Appendix A.

3.0 RUNOFF CONTROL

Control measures were implemented to capture wastewater, slurry, and debris generated during removal and replacement of CJM and to prevent CJM from entering the stormwater drainage system. The control measures implemented included the following:

- **Air-Powered Drum Vacuums.** These were used during all cutting and pressure washing activities and when removal activities were performed during periods of light rain.
- **Street Sweeper.** A street sweeper was used to scrub and vacuum dry surfaces around the work area where CJM was being removed.
- **Weather Restrictions.** CJM removal and replacement was not performed during periods of significant rain, typically based on the presence of rainwater pooling inside the open joints.
- **Sequencing.** Although the NBF site is fairly flat, to the extent possible, CJM removal was sequenced such that work began uphill and progressed downhill to facilitate control and capture of any wastewater, surface water, and slurry.
- **Catch Basin Filters or Other Control Devices.** Prior to removal of CJM, catch basin filters, inflatable plugs, water dams, and plastic linings were used, as needed, to prevent runoff from the work area entering storm drain systems.

4.0 MANAGEMENT OF WASTE

All wastewater generated during removal of PCB-containing CJM and wastewater generated during decontamination activities was contained and properly managed. Wastewater was collected and treated to less than 3 micrograms per liter ($\mu\text{g/L}$) total PCBs using flocculants, particulate filters, and/or carbon treatment prior to entering the NBF Sweeper Decant Station for further treatment through solids settling and additional carbon filtration methods. Treated wastewater that met the NBF Sweeper Decant Station's discharge limits, as required by Boeing's King County Industrial Waste Permit, was discharged to the sanitary sewer. These measures conform to the Toxic Substances Control Act (TSCA) regulations 40 C.F.R. § 761.50(a)(3). A process flow diagram for solids and wastewater treatment procedures is provided on Figure 3. Due to the treatment capacity of the primary NBF Sweeper Decant Station, wastewater may have been processed in a temporary treatment system, meeting the requirements for discharge described above. No treated wastewater was discharged to the Lower Duwamish Waterway.

All solid waste containing total PCBs greater than or equal to 50 mg/kg was contained in drums, cubic yard boxes, or lined roll-off boxes and disposed of at the Waste Management NW landfill in Arlington, Oregon, a chemical waste landfill permitted under 40 C.F.R. § 761.75 to accept PCB bulk product waste. All solid waste known to contain total PCBs less than 50 mg/kg was managed in accordance with Chapter 173-303 WAC.

5.0 DECONTAMINATION

Non-disposable and nonporous equipment, such as concrete saws, pressure washers, drum vacuums, and small tools that came into contact with CJM was decontaminated after each use. Decontamination of equipment after removal of CJM containing total PCBs greater than or equal to 50 mg/kg was performed using pressure washing, steam cleaning, and/or hand-wiping with the appropriate solvent in accordance with the decontamination procedures required under 40 C.F.R. § 761.79, or were discarded as contaminated PCB bulk product waste and placed into a roll-off box to be disposed of at Waste Management NW landfill, a chemical waste landfill permitted to accept PCB bulk product waste under 40 C.F.R. § 761.75. Only parts of the equipment that were likely to have been in contact with PCB-containing materials were decontaminated. All wastewater generated during decontamination was collected and treated as described in Section 4.0 above.

6.0 CONCLUSION

All CJM known to contain PCBs greater than or equal to 50 mg/kg was removed. No CJM containing total PCBs greater than or equal to 50 mg/kg is known to be present at NBF.

Urexpan[®] NR-300

Technical Specifications Data Sheet

Urexpan® NR-300

Jet Fuel & Blast Resistant Traffic-Grade Sealant

Specification Data Sheet

1. BASIC USES

• Urexpan® NR-300 is designed specifically for sealing joints in airport runways, terminal ramps, hangars and transportation storage areas, but is equally effective in driveways, parking decks, sidewalks or other areas where the various fuels and liquids may come into contact with the sealant after curing.

2. MANUFACTURER

Pecora Corporation
165 Wambold Road
Harleysville, PA 19438
Phone: 215-723-6051
800-523-6688
Fax: 215-721-0286
Website: www.pecora.com

3. PRODUCT DESCRIPTION

Urexpan® NR-300 is a two-part, chemically-curing, cold-applied self-leveling modified polyurethane elastomeric sealant that withstands heavy vehicular traffic and is virtually unaffected by jet fuel, hydraulic fluids, oil or lubricants. It is available in two versions: hand mix (Type H) and machine mix (Type M), the only difference being the rate of cure.

Limitations: Not recommended for joints contaminated with oil, grease, wax, curing compounds, concrete sealers, form release agents, etc. Not for use in joints less than 1/4" (6 mm) wide.

Note: Urexpan® NR-300 is not to be used as a structural component or in longitudinal expansion joints that are intended to be used on a constant traveling surface.

PACKAGING

- 4-gallon units (15.14 L) Hand mix
 - 10-gallon units (416.35 L) Machine mix
 - 110-gallon unit Machine Mix
- A unit consists of equal volumes of base and activator.

COLOR

- Dark Bronze - Base
- Golden Bronze - Activator

4. TECHNICAL DATA

Applicable Standards: Meets the requirements of Federal Specifications: SS-S-200E; SS-S-195B & TT-S-00227E: ASTM D-1850; ASTM C-920 & PA DOT 408/90.

Independent Testing: When submitting samples of NR-300 to outside agencies for the purpose of specification testing, please contact Pecora Technical Services for a sample submittal form. Fill out the form completely and return. The test sample then will be shipped to you for submittal.

Joint Design: The width of the joint should be a minimum of 8 times the anticipated movement. The width or depth of the joint should not be less than 1/4" (6 mm). In joints up to 1/2" (12 mm) wide, the depth of the sealant should be equal to the width. In joints wider than 1/2" (12 mm), but not exceeding 1" (25 mm), the depth should be maintained at 1/2" (12 mm). For joints wider than 1" (25 mm), please consult our Technical Services department.

5. INSTALLATION

Surface Preparation: Surfaces must be clean and dry. The presence of moisture will cause gassing before the sealant achieves ultimate cure. Oil, grease, wax, form release agents, curing compounds, laitance and old caulking compounds must be removed by sandblasting or sawing to sound, virgin concrete for optimum sealant performance.

Priming: Primers should always be used in extended exterior exposure applications where horizontal joints may be subject to conditions of standing water, ice, jet fuel or other liquids. With Urexpan® NR-300, P-75 is used on concrete and P-100 on metal. Primers should be dry before the sealant is applied. Drying time for P-75 is one hour at 75° F (24° C) and 15 minutes for P-100. The sealant must be applied within 8 hours after priming. For further information on primers, send for Technical Bulletins #25 and #28.

Note: Priming is never a substitute for proper surface preparation as outlined in the section above.

TYPICAL PHYSICAL PROPERTIES at 75°F (24°C), 50% RH

Test Property	Value	Test Procedure
Hardness, Shore OO		
Initial	12-15	ASTM C661
Ultimate	23-24	ASTM C661
Initial Cure		
Hand mix (hours)	24	ASTM C679
Machine mix (minutes)	30	ASTM C679
Jet Fuel Immersion (hours)	24	Meets req. of SS-S-200E
Maximum Movement Capability		
Extension (%)	12.5	ASTM C719
Compression (%)	12.5	ASTM C719
Extension (%)	50.0	SS-S-200E
Pot Life		
Hand mix (hours)	4	Pecora Corporation
Machine mix (minutes)	15	Pecora Corporation
Resilience recovery (%)	75	ASTM D5329
Tack-Free to Touch		
Hand mix (hours)	6	ASTM C679
Machine mix (minutes)	30	ASTM C679
Open to Traffic		
Hand and Machine mix (hours)	48	Pecora Corporation
VOC Content (g/L)		
Activator	100	D3960
Base	100	D3960

Joint Backing: Close cell polyethylene backer rod should be used to control the depth of the sealant. Use a size that will compress 25% when inserted into the joint. Non-porous semi-rigid backing materials may be used if a bondbreaker tape is applied to prevent adhesion of the joint filler. Dry, clean sand may be used as a joint filler in interior areas where freezing temperatures are not anticipated and joint movement is minimal.

Mixing: Type H - Pour equal volumes of activator and base into a clean container of sufficient capacity to permit mixing of the two components. Thoroughly blend the activator and base for a minimum of 5 minutes using a heavy-duty, low-speed drill (200 to 400 rpm) with a Pecora #2 Mixing Paddle or a Pecora Prop Mixer. Scrape sides and bottom of container frequently; keep the mixer below the surface to avoid entraining air.

Type M - Pour equal volumes of activator and base into the appropriate holding tanks of the mixing machine. Activator should be mixed prior to use, to remove any setting that may have occurred during storage and shipping. Use collapsible blade in large bung hole to avoid ambient air entrainment. Activator and base should arrive at the mixing head on a 1:1 ratio by volume. Before filling the joints, extrude and cure a test sample to see that a correct mix is achieved.

Note: In containers, it may be difficult to distinguish between activator and base colors. If it is necessary to do so, smear a sample of each on a white surface. The dark bronze material is the base, and the golden bronze colored material is the activator. See technical bulletin #78 for more information. Mix drums thoroughly before conducting color check.

Application: Fill joints at temperatures between 40° F (5° C) and 90° F (32° C). Lower temperatures will delay the cure; higher temperatures will decrease pot life and accelerate cure.

If the joint is inclined on a slope greater than 1.5%, it will be necessary to dam the joint at intervals with Backer Rod to prevent excessive flow. When the sealant has achieved partial cure, the Backer Rod can be removed and the resulting voids filled with sealant.

Cleaning: Clean tools, hands and spillage as soon as possible with xylene* or toluene*.

**(Solvents mentioned are toxic and flammable; observe manufacturers precautions and refer to Material Safety Data Sheets).*

Storage Life: Approximately 6 months when stored at temperatures lower than 80° F (27° C) in original, sealed containers. After a container has been opened, the contents should be used as soon as possible. Exposure to moisture in the air considerably shortens storage life.

Precautions: Despite its elasticity and abrasion resistance, Urexpan® NR-300 can be damaged by sharp objects such as spike heeled shoes, snowplow blades, studded tires, etc.

Contains diisocyanates; avoid prolonged breathing of vapors and contact with skin and eyes. Wash hands thoroughly with soap and water after use and before eating or smoking. Upon accidental contact with eyes, flush thoroughly with water and seek medical attention immediately. Refer to Material Safety Data Sheet.

**FOR PROFESSIONAL USE ONLY.
KEEP OUT OF THE REACH
OF CHILDREN.**

6. AVAILABILITY AND COST

Pecora products are available from stocking distributors nationwide. For the name and telephone number of your nearest representative, call the number below or visit our website at www.pecora.com.

7. WARRANTY

Pecora Corporation warrants its products to be free of defects. Under this warranty, we will provide, at no charge, replacement materials for, or refund the purchase price of, any product proven to be defective when used in strict accordance with our published recommendations and in applications considered by us as suitable for this product. The determination of eligibility for this warranty, or the choice of remedy available under this warranty, shall be made in our sole discretion and any decisions made by Pecora Corporation shall be final. This warranty is in lieu of any and all other warranties, expressed or implied, including but not limited to a warranty of merchantability or fitness for a particular purpose and in no case will Pecora be liable for damages other than those expressly stated in this warranty, including but not limited to incidental or consequential damages.

8. MAINTENANCE

If the sealant is damaged and the bond is intact, cut out the damaged area and prime with P-200 Primer and recaulk. If the bond has been affected, remove the sealant, clean and prepare the joint in accordance with the instructions under "Installation".

9. TECHNICAL SERVICES

Pecora representatives are available to assist you in selecting an appropriate product and to provide on-site application instructions or to conduct jobsite inspections. For further assistance call our Technical Service Department at 800-523-6688.
